

Please use the above provided wind slit in your artwork before sending it to us. It is full scale and the correct color. Place it on its own layer in your design file(s). For more details please see additional info at the bottom of the page.

Now review the uniform and non-uniform images below to determine the best placement of wind slits in your artwork. The following guidelines provide a good rule of thumb to follow.

1. If you are more concerned with how well the product will hold up against wind then uniform placement is the best method for you to use.
2. If you are more concerned with how well your product looks aesthetically then non-uniform placement is the best method to use.

Wind slits help reduce wind load. The more wind slits, the less wind load. This minimizes damage to the banner. As many or as few wind slits as desired can be added. When building your file use this template, already at full scale. Please put wind slits on a separate layer from your artwork.
